Dear Homeowners - this letter is being sent only to keep you informed about certain aspects of the mechanicals of 1400 N Sweetzer.

As you are probably aware, our cooling and heating is provided by either cold water or hot water circulating through a "fan coil" which is located in your unit. Your thermostat, depending upon its settings, sends a signal to a device called an "actuator" to open valves to allow cold or hot water into your fan coil which then provides you hot air or cold air. These actuators are specific to your unit and are your responsibility to replace should they fail.

Most of the actuators in the building are original to the HVAC system which was installed in 2008.

This document is just to let you know that should the actuators fail in your unit, you may use whomever you wish to replace them. They cannot be repaired. Each unit has four actuators, 2 for heat, 2 for cooling. Generally, it is either heat or cooling that fails, rarely both at the same time. The actuators themselves are approximately \$250.00 EACH (as of 2020).

If you use the vendor who maintains our current HVAC system for repair, be aware they are a union shop and the actuator replacement requires 2 men due to OSHA guidelines. So far, replacement costs have been approximately \$2,200.00 (as of 2020) (parts and labor, fuel surcharge, trip charge, disposal fee etc.).

Again, you may use whomever you wish to replace your actuators should they fail. Also, it is cost effective to first make sure that your thermostat is functioning correctly before replacing the actuators.

Finally, if you use your A/C-Heating a lot, changing the filter on a regular basis (every 3-4 months) will go a long way in allowing your fan coil unit to operate as efficiently as possible.

Any questions, please contact a member of the Board.....
